

Performance Measures Table

Questions to Consider	Example Response*	Response
“What data can we easily access or collect to measure our identified indicators?”	Track the proportion of police who have completed the training; the number of naloxone kits distributed to police; the number of “leave behind” kits distributed; the number and percent of suspected overdose calls in which naloxone is administered by police.	
“What are our “best” (based on accessibility/feasibility, and accuracy) measures and data sources?”	Determine based on PHAST partner input and available or easily created data tracking systems.	
“What is our target for each measure?”	Determine based on contextual knowledge of partners and baseline data on naloxone administration by police.	
“What is our expected timeline for seeing results? How frequently can we measure our success?”	Determine based on partner input and overdose rate.	
“What data can we collect to help us understand the equity impact of our intervention? How will we be able to determine if certain groups are more responsive to, or are benefiting more from this intervention than other groups? What groups do we consider?”	Determine based on characteristics of people who have overdosed, people at risk of overdose, and people with Opioid Use Disorder (OUD) in the community.	

*Example responses are included in the column to the right of each corresponding question and are based on a naloxone leave-behind program.
